Round 3A **Answer board**

Tasks / plugins-kit:task-kit-extraction

Task kit extraction

P1 active 2 need you

Answers are refreshed independently from commits. Exact facts come from scripts; interpretation uses the cheapest capable model.

Answering service On - Spend usage Off

Dashboard settings / Answers

Concept: Every question is a card. The answerer tier is part of the answer: green script facts are exact for their listed inputs; model answers are interpretations with their own as-of time.

WHAT IS THIS TASK FOR?

Make the task system independent, operational, and easy to re-enter.

The extraction is complete. The current product problem is a dashboard that explains active work before it offers automation.

local qwen as of task record 10:42 current

WHAT ARE THE CURRENT FACTS?

18m last activity age	**3** open items
2 waiting on you	**active** stale signal: no

script - exact task record + sessions read 10:47

WHERE DOES IT STAND?

Session tracking is ready; the detail view is still being chosen.

No engineering blocker is visible. The next live UI change should follow this design ruling.

local qwen as of task record 10:42 current

WHICH COMMITS BELONG TO IT?

`8ab21c4` prepare durable session records
latest task commit, 09:58

`f3027ae` separate local and remote sessions
task history match, 09:31

script - exact task commit refs + git read 10:47

WHAT CHANGED SINCE THE LAST SESSION?

Session tracking landed and detail-view work advanced to round 2.

A newer task-record edit at 10:42 is not reflected in this answer.

local qwen answer as of 09:55 inputs now 10:42 stale

WHAT SHOULD HAPPEN NEXT ACROSS RELEASE AND DESIGN WORK?

Waiting: spend usage is off

Local Qwen declined this cross-stream planning question. Luna is the next capable answerer, but paid-model use is disabled.

luna - paid not run enable in Dashboard settings / Answers

IS IT STALE OR ABANDONED?

No. Activity is recent and an active local session is attached.

script - exact activity + session rules read 10:47

Cheapest capable answerer

Script first for deterministic facts and signals; local Qwen for interpretation; Luna, then Haiku, only when spend usage is enabled. Each answer ages against its own inputs, not against a commit boundary.
