TASK DETAIL MOCKUPS - ROUND 3

Three ways to read independently refreshed answers

This index shows a faithful first-screen excerpt of every concept. All three use the same service policy and answerer order: script, local Qwen, then Luna or Haiku only when spend usage is enabled.

Proposed control location

Put one service control at **Dashboard settings / Answers**, not per task. Task pages show a compact status strip and a link back to that setting.

Answering service **On** - Spend usage **Off** -

Dashboard settings / Answers

Why all three remain

Round 2 produced no preferred direction, and these still test three different primary objects: individual answers, a handoff brief, or intent-specific views. Round 3 changes the answer system, not that choice.

Compare the screens first. The captions name the structural argument; the Judge line names the decision each concept tests.

Concept A

Answer board

Each question stays visible as an independently aging answer card.

Task kit extraction **service on** **spend off**

Task kit extraction

Answer board - exact facts beside interpretation

WHAT IS THIS TASK FOR?
Make active work easy to understand and resume.
local qwen as of 10:42

CURRENT FACTS
18m activity - 3 open - 2 need you
script - exact read 10:47

WHAT SHOULD HAPPEN NEXT?
Waiting: spend usage is off
Local declined; Luna is next.
luna - paid not run

Judge: Should the default view expose each question, answerer, and freshness boundary directly?

Concept B

Cited briefing

A coherent handoff leads; exact script facts interrupt it as evidence.

Task kit extraction **service on** **spend off**

ORIENTATION BRIEF
Choose the detail shape before release.

Purpose
Make the dashboard easy to re-enter.
local qwen as of 10:42

Exact checkpoint
18m activity; 3 open; stale signal: no.
script - exact read 10:47

Cross-stream next action
Waiting: spend usage is off.
luna - paid not run

Judge: Should the primary object be one readable brief, with answer boundaries visible but secondary?

Concept C

Question lenses

Orient, Decide, and Trace separate interpretation, choices, and exact evidence.

Task kit extraction **service on** **spend off**

Orient | Decide | Trace

PURPOSE
Make work easy to understand and resume.
local qwen current

EXACT STATE
18m activity - 3 open - 2 need you
script - exact 10:47

ACROSS BOTH STREAMS
Waiting: spend usage is off
luna - paid not run

Judge: Are intent-specific lenses worth navigation so Trace can make script facts primary?

script - exact
Deterministic output, current for the listed input read. Used first for ages, commits, counts, history, and stale signals.

local qwen
Free local interpretation. Carries an as-of and becomes stale when its inputs advance.

luna / haiku - paid
Used only when local cannot answer and spend usage is enabled. Otherwise the answer waits visibly.
